would see a projected portion of that or if you're seeing the ceiling surface, you would see the light that's on the ceiling surface also that's correct. And what I wanted to put up here, just as comparison, the Markatos family was concerned that we would have this glowing band at 60 feet long, and I hope the last slide shows we don't really expect that.

The second piece that I wanted to talk about here is exactly what you just brought up, and the question is do you still read this glow for the entire length, because you're seeing the roof surface, and on the ground surface we talked about the amount of light there. It's from -- it ranges in order of magnitude of 10 percent to 50 percent of what you would see from a candle lit a foot away landing on the ground.

And then the second point to note here is because -- this is another point I was trying to make in the previous presentation, but I didn't have a slide to show it and this shows it. We do have light on the underside of the ceiling surface and on the covered walkway between the buildings. But from the view from Smith Ridge Road, which is what you're seeing at the top, you're largely seeing external roof, which means that the internal, the underside of
